Title: Creation of GitHub Repository and Website Prototype Design

Submitted by

Name: Panchal Jainil J

Enrollment Number: 2502031030057

Course: Bachelor of Technology (Information Technology)

Semester: 4

Academic Year: 2025–26

Subject: Web Technology with UI/UX

Introduction

GitHub is a web-based platform used for version control and collaboration in software development. It allows developers to store their projects, manage code changes, and collaborate with others efficiently. In this assignment, a GitHub repository was created using the enrollment number as the repository name. The repository was organized with specific folders to store the prototype design and the implementation of the website using HTML and CSS.

The purpose of this assignment is to understand how to create and manage repositories in GitHub and how to organize project files properly. It also helps in learning the basic workflow used in modern web development projects.

Objective of the Assignment :

The main objectives of this assignment are:

- To understand the concept of GitHub repositories.
- To create a repository using the enrollment number.
- To organize project files using folders.
- To upload assignment-related files into the appropriate folders.
- To prepare and manage project resources using GitHub.

Procedure / Steps Followed

Step 1: Opening the GitHub Website

First, I opened a web browser and visited the official GitHub website at <https://github.com>. GitHub is widely used by developers to store and manage code repositories online.

Step 2: Logging into the GitHub Account

After opening the GitHub website, I logged into my GitHub account using my registered email address and password. If a user does not have a GitHub account, they can create a new account by signing up on the website.

Step 3: Creating a New Repository

Once logged in, I clicked on the “New Repository” option available on the GitHub dashboard. While creating the repository, I entered my enrollment number as the repository name.

Repository Name: 2502031030057

The repository was set as a public repository so that it can be accessed and reviewed if required. After filling the required details, I clicked on the “Create Repository” button to successfully create the repository.

Step 4: Accessing the Created Repository

After creating the repository, GitHub redirected me to the repository dashboard page. This page displays the repository structure, files, and other management options such as adding files, uploading content, and editing repository details.

Step 5: Creating the Assignment_1 Folder

Inside the repository, I created the first folder named “Assignment_1”. This folder is used to store the prototype design files of the website created using Figma and the Word document explaining the steps of the assignment.

Step 6: Creating the Assignment_2 Folder

Next, I created another folder named “Assignment_2”. This folder will contain the HTML and CSS code of the website developed based on the prototype design created in Assignment_1.

Step 7: Organizing the Repository Structure

After creating both folders, the repository structure was organized as follows:

```
2502031030057
|
├── Assignment_1
└── Assignment_2
```

This structure helps in properly managing and separating the design files and the implementation files.

Step 8: Preparing the Assignment Documentation

After setting up the repository structure, a Word document was prepared explaining all the steps involved in creating the GitHub repository and organizing the folders. This document helps in demonstrating the understanding of the repository creation process.

Step 9: Uploading Files to the Repository

The prepared files and resources related to the assignment are uploaded to their respective folders using the GitHub upload option. This ensures that all assignment-related materials are stored and managed within the repository.

Tools Used

- GitHub – for repository creation and file management
- Figma – for designing website prototype
- Web Browser – for accessing GitHub and Figma

Conclusion

In this assignment, a GitHub repository was successfully created using the enrollment number as the repository name. Two folders named Assignment_1 and Assignment_2 were created inside the repository to organize the project files properly.

This assignment helped in understanding the basic workflow of GitHub, including repository creation, folder organization, and file management. It also provided practical experience in managing project resources using a version control platform.
